OpenCL (Open Computing Language) is a multi-vendor open standard for general-purpose parallel programming of heterogeneous systems that include CPUs, GPUs, and other processors. OpenCL provides a uniform programming environment for software developers to write efficient, portable code for high-performance compute servers, desktop computer systems, and handheld devices. Specifications and online reference available at www.khronos.org/opencl.

OpenCL Class Diagram

The figure below describes the OpenCL specification as a class diagram using the Unified
Modeling Language[1] (UML) notation. The diagram shows both nodes and edges which
are classes and their relationships. As a simplification it shows only classes, and no
attributes or operations.

Annotations	
Relationships	
abstract classes	{abstract}
aggregations	♦
inheritance	△
relationship navigability	∧

OpenCL Device Architecture Diagram

The table below shows memory regions with allocation and memory access capabilities.
R=Read, W=Write

	Host	Kernel
Global	Dynamic allocation R/W access	No allocation R/W access
Constant	Dynamic allocation R/W access	Static allocation R-only access
Local	Dynamic allocation No access	Static allocation R/W access
Private	No allocation No access	Static allocation R/W access

This conceptual OpenCL device architecture diagram shows processing elements (PE), compute units (CU), and devices. The host is not shown.

These operators behave similarly as in C99 except operands may include vector types when possible:

+	-	*	%	/	--
++	==	!=	&	~	^
>	<	>=	<=	|	!
&&	||	?:	>>	<<	=
,	op=	sizeof			

Address Space Qualifiers [6.5]

__global, global   __local, local
__constant, constant   __private, private

__attribute__((work_group_size_hint(*X, Y, Z*)))
__attribute__((reqd_work_group_size(*X, Y, Z*)))

Blocks [6.12]

A result value type with a list of parameter types, similar to a function type. In this example:
1. The ^ declares variable "myBlock" is a Block.
2. The return type for the Block "myBlock"is int.
3. myBlock takes a single argument of type int.
4. The argument is named "num."
5. Multiplier captured from block's environment.

```
     ②    ①       ③
int (^myBlock)(int) =
 ^(int num) {return num * multiplier;
                          ④           ⑤

Synchronization & Memory Fence Functions [6.13.8]

flags argument is the memory address space, set to a 0 or an OR'd combination of CLK_X_MEM_FENCE where *X* may be LOCAL, GLOBAL, or IMAGE. Memory fence functions provide ordering between memory operations of a work-item. Sub-groups require the cl_khr_subgroups extension.

Atomic Functions [6.13.11]

OpenCL C implements a subset of the C11 atomics (see 7.17 of the C11 spec.) and synchronization operations.

Atomic Functions

In the following definitions, **A** refers to one of the atomic_* types. **C** refers to its corresponding non-atomic type. **M** refers to the type of the other argument for arithmetic operations. For atomic integer types, **M** is **C**. For atomic pointer types, **M** is ptrdiff_t. The type atomic_* is a 32-bit integer. atomic_long and atomic_ulong require extension cl_khr_int64_base_atomics or cl_khr_int64_extended_atomics. The atomic_double type requires double precision support. The default scope is work_group for local atomics and all_svm_devices for global atomics.

See the table under Atomic Types and Enum Constants for information about parameter types memory_order, memory_scope, and memory_flag.

void **atomic_init**(volatile A *obj, C value)	Initializes the atomic object pointed to by obj to the value value.
void **atomic_work_item_fence**(cl_mem_fence_flags flags, memory_order order, memory_scope scope)	Effects based on value of order. flags must be CLK_{GLOBAL, LOCAL, IMAGE}_MEM_FENCE or a combination of these.
void **atomic_store**(volatile A *object, C desired) void **atomic_store_explicit**(volatile A *object, C desired, memory_order order[, memory_scope scope])	Atomically replace the value pointed to by object with the value of desired. Memory is affected according to the value of order.
C **atomic_load**(volatile A *object) C **atomic_load_explicit**(volatile A *object, memory_order order[, memory_scope scope])	Atomically returns the value pointed to by object. Memory is affected according to the value of order.
C **atomic_exchange**(volatile A *object, C desired) C **atomic_exchange_explicit**(volatile A *object, C desired, memory_order order[, memory_scope scope])	Atomically replace the value pointed to by object with desired. Memory is affected according to the value of order.
bool **atomic_compare_exchange_strong**(volatile A *object, C *expected, C desired) bool **atomic_compare_exchange_strong_explicit**(volatile A *object, C *expected, C desired, memory_order success, memory_order failure[, memory_scope scope]) bool **atomic_compare_exchange_weak**(volatile A *object, C *expected, C desired) bool **atomic_compare_exchange_weak_explicit**(volatile A *object, C *expected, C desired, memory_order success, memory_order failure[, memory_scope scope])	Atomically compares the value pointed to by object for equality with that in expected, and if true, replaces the value pointed to by object with desired, and if false, updates the value in expected with the value pointed to by object. Further, if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. These operations are atomic read-modify-write operations.
C **atomic_fetch_<key>**(volatile A *object, M operand) C **atomic_fetch_<key>_explicit**(volatile A *object, M operand, memory_order order[, memory_scope scope])	Atomically replaces the value pointed to by object with the result of the computation applied to the value pointed to by object and the given operand. Memory is affected according to the value of order. <key> is to be defined.
bool **atomic_flag_test_and_set**(volatile atomic_flag *object) bool **atomic_flag_test_and_set_explicit**(volatile atomic_flag *object, memory_order order[, memory_scope scope])	Atomically sets the value pointed to by object to true. Memory is affected according to the value of order. Returns atomically, the value of the object immediately before the effects.
void **atomic_flag_clear**(volatile atomic_flag *object) void **atomic_flag_clear_explicit**(volatile atomic_flag *object, memory_order order[, memory_scope scope])	Atomically sets the value pointed to by object to false. The order argument shall not be memory_order_acquire nor memory_order_acq_rel. Memory is affected according to the value of order.

Image Read and Write Functions [6.13.14]
The built-in functions defined in this section can only
be used with image memory objects created with
clCreateImage. *sampler* specifies the addressing and
filtering mode to use. Writing to sRGB images from a
kernel requires the cl_khr_srgb_image_writes extension.
read_imageh and **write_imageh** require the
cl_khr_fp16 extension. MSAA images require the
cl_khr_gl_msaa_sharing extension, and image 3D writes
require the extension cl_khr_3d_image_writes.

OpenCL Extensions Reference

Using OpenCL Extensions [9]
The following extensions extend the OpenCL API. Extensions shown in *italics* provide core features.

To control an extension: #pragma OPENCL EXTENSION *extension_name* : {enable | disable}

To get the address of the extension function:
clGetExtensionFunctionAddressForPlatform()
