## Exercises on the Topics of class 11

## Exercises with a solution

Ex. 1. Let us consider the following boolean functions $f(x, y, z, t)$ and $g(x, y, z, t)$ such that:

- $f$ returns 1 if and only if the string xyzt contains an even number of 1 s ;
- $g$ returns 1 if and only if the string xyzt, seen as an integer number, is divisible by 2.

For $f$ and $g$ give: the canonical forms (conjunctive and disjunctive), the minimal SOP and POS forms and finally a minimal boolean expression (obtained by using the NAND, NOR, XOR and XNOR gates)

## SOLUTION:

The tabular representation of $f$ and $g$ is:

| $\boldsymbol{x}$ | $\boldsymbol{y}$ | $\boldsymbol{z}$ | $\boldsymbol{t}$ | $\boldsymbol{f}$ | $\boldsymbol{g}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 0 | 1 | 0 | 0 |
| 0 | 0 | 1 | 0 | 0 | 1 |
| 0 | 0 | 1 | 1 | 1 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 |
| 0 | 1 | 0 | 1 | 1 | 0 |
| 0 | 1 | 1 | 0 | 1 | 1 |
| 0 | 1 | 1 | 1 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 1 |
| 1 | 0 | 0 | 1 | 1 | 0 |
| 1 | 0 | 1 | 0 | 1 | 1 |
| 1 | 0 | 1 | 1 | 0 | 0 |
| 1 | 1 | 0 | 0 | 1 | 1 |
| 1 | 1 | 0 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 1 | 1 | 1 | 0 |

Let's denote with mi and Mi (for $\mathrm{i}=0, \ldots, 15$ ) the minterm and the maxterm associated to the i-th row of the table. For example,

$$
\mathrm{m} 2=\bar{x} \cdot \bar{y} \cdot z \cdot \bar{t} \quad \text { and } \quad \mathrm{M} 2=x+y+\bar{z}+t
$$

With this formalism, the canonical forms are:
$\mathrm{FCD}(f)=\mathrm{m} 0+\mathrm{m} 3+\mathrm{m} 5+\mathrm{m} 6+\mathrm{m} 9+\mathrm{m} 10+\mathrm{m} 12+\mathrm{m} 15$
$\mathrm{FCC}(f)=\mathrm{M} 1 \cdot \mathrm{M} 2 \cdot \mathrm{M} 4 \cdot \mathrm{M} 7 \cdot \mathrm{M} 8 \cdot \mathrm{M} 11 \cdot \mathrm{M} 13 \cdot \mathrm{M} 14$
$\mathrm{FCD}(g)=\mathrm{m} 0+\mathrm{m} 2+\mathrm{m} 4+\mathrm{m} 6+\mathrm{m} 8+\mathrm{m} 10+\mathrm{m} 12+\mathrm{m} 14$
$\operatorname{FCC}(g)=\mathrm{M} 1 \cdot \mathrm{M} 3 \cdot \mathrm{M} 5 \cdot \mathrm{M} 7 \cdot \mathrm{M} 9 \cdot \mathrm{M} 11 \cdot \mathrm{M} 13 \cdot \mathrm{M} 15$

For the minimal normal forms, we can easily check (by writing down the KM) that the minimal SOP and POS for $f$ are the canonical forms. For $g$ we have that:

| $x y^{z t}$ | 00 | 01 | 11 | 10 |
| :---: | :---: | :---: | :---: | :---: |
| 00 | 1 | 0 | 0 | 1 |
| 01 | 1 | 0 | 0 | 1 |
| 11 | 1 | 0 | 0 | 1 |
| 10 | 1 | 0 | 0 | 1 |

and so $\operatorname{minSOP}(g)=\bar{t}$. For the minPOS, we can use $g$ 's KM and cover the 0 s or observing that

$$
\operatorname{minPOS}(g)=\operatorname{minPOS}(\neg g)
$$

that is, we have to cover the 1 s of the following map:

| $x y^{z t}$ | 00 | 01 | 11 | 10 |
| :---: | :---: | :---: | :---: | :---: |
| 00 | 0 | 1 | 1 | 0 |
| 01 | 0 | 1 | 1 | 0 |
| 11 | 0 | 1 | 1 | 0 |
| 10 | 0 | 1 | 1 | 0 |

In both cases, we obtain that $\operatorname{minPOS}(g)=\bar{t}$.
Finally, for the minimal BEs, it is easy to see that the minimal expression for $g$ is the minSOP (that coincides with the minPOS). For $f$, by using XORs and NXORs (respectively denoted by $\oplus$ and $\otimes)$ and by properly factoring the CCF, we have that

```
FCC(f)=(x+y+z+t) (x+y+\underline{z}+t)(x+y+z+t)(x+y+z+t)(\underline{x}+y+z+t)(\underline{x}+y+\underline{z}+\underline{t})(\underline{x}+\underline{y}+z+\underline{t})(\underline{x}+\underline{y}+\underline{z}+t)
    =(x+y+(z+\underline{t})(\underline{z}+t))(x+y+(z+t)(\underline{z}+\underline{t}))(\underline{x}+y+(z+t)(\underline{z}+\underline{t}))(\underline{x}+\underline{y}+(z+\underline{t})(\underline{z}+t))
    =(x+y+(z\otimest))(x+y+(z\oplust))(\underline{x}+y+(z\oplust))(\underline{x}+y+(z\otimest))
    = ((x+y)(\underline{x}+y)+(z\otimest))((x+y)(\underline{x}+y)+(z\oplust))
    = ((x\oplusy)+(z\otimest)) ((x\otimesy)+(z\oplust))
    = (x\oplusy)\otimes(z\oplust)
```

Indeed, it is easy to check that $(a+\underline{b})(\underline{a}+b)=(a \otimes b)$ and $(a+b)(\underline{a}+\underline{b})=(a \oplus b)$. For example,

$$
(a+\bar{b})(\bar{a}+b)=\overline{\overline{(a+\bar{b})}+\overline{(\bar{a}+b)}}=\overline{\bar{a} b+a \bar{b}}=\overline{a \oplus b}=a \otimes b
$$

Hence,

$$
\operatorname{minEB}(f)=(x \oplus y) \otimes(z \oplus t)
$$

## Exercises without solutions

Ex. 1. Let us consider the function that returns 1 only when its ( 4 bit ) input represents an integer in 2's complement that is a multiple of 3. Do not consider 1000 (i.e., on that sequence the function is undefined). Give a minimal SOP and POS associated to this function.

Ex. 2. Find the minimal SOP associated to the expression $(x \oplus(y$ NAND $z)$ ) NOR $\bar{x}$
