## Exercise 1 (4 points) - GPU \& CUDA

You need to write a kernel that operates on a matrix of size $680 \times 800$. You would like to assign one thread to each matrix element. You would like your thread blocks to use the maximum number of threads per block possible on your device, having compute capability 3.5 .
a) How would you select the dimensions of a 2D grid and 2D blocks for your kernel? Consider the two cases of rectangular and square blocks for the x and y dimensions.
b) What is the best choice for grid and block dimensions with respect to the number of idle threads?

| Technical specifications | Compute capability (version) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1.0 | 1.1 | 1.2 | 1.3 | 2.x | 3.0 | 3.5 | 3.7 | 5.0 | 5.2 |
| Maximum dimensionality of grid of thread blocks | 2 |  |  |  | 3 |  |  |  |  |  |
| Maximum x-dimension of a grid of thread blocks | 65535 |  |  |  |  | $2^{31}-1$ |  |  |  |  |
| Maximum y-, or z-dimension of a grid of thread blocks | 65535 |  |  |  |  |  |  |  |  |  |
| Maximum dimensionality of thread block | 3 |  |  |  |  |  |  |  |  |  |
| Maximum x- or y-dimension of a block | 512 |  |  |  | 1024 |  |  |  |  |  |
| Maximum z-dimension of a block | 64 |  |  |  |  |  |  |  |  |  |
| Maximum number of threads per block | 512 |  |  |  | 1024 |  |  |  |  |  |
| Warp size | 32 |  |  |  |  |  |  |  |  |  |
| Maximum number of resident blocks per multiprocessor | 8 |  |  |  |  |  | 16 |  |  |  |
| Maximum number of resident warps per multiprocessor | 24 |  | 32 |  | 48 | 64 |  |  |  |  |
| Maximum number of resident threads per multiprocessor | 768 |  | 1024 |  | 1536 | 2048 |  |  |  |  |
| Technical specifications | 1.0 | 1.1 | 1.2 | 1.3 | 2.x | 3.0 | 3.5 | 3.7 | 5.0 | 5.2 |
|  | Compute capability (version) |  |  |  |  |  |  |  |  |  |

## Exercise 2 (4 points) - Interconnection Networks - CLOS

Design a Clos network of size $100 \times 100$, using modules $8 \times 8$. In the first stage, only 8 inputs per module are allowed.
Consider both cases, strictly non-blocking and rearrangeable network.

## Exercise 3 (4 points) - Interconnection networks - ( $2 \log N-1$ ) MIN

Briefly explain how the looping algorithm works.

Complete the scheme of the Benes (left) and Butterfly (right) networks. Show the switch setting to realize permutation $P=\binom{01234567}{15064723}$ according to the looping algorithm for the Benes network and the self-routing algorithm for the Butterfly.

## Question 1 (3 points)

## Briefly explain the performance equation

## Question 2 (3 points)

Briefly describe the Hypercube, mesh and tree networks, highlighting their differences.
$\qquad$

## Exercises 4 (4 points) Amdhal Law

The following measurements are recorded with respect to the different instruction classes for the instruction set running a given set of benchmark programs:

| Instruction Type | Instruction Count (millions) | Cycles per Instruction |
| :---: | :---: | :---: |
| Arithmetic and logic | 5 | 8 |
| Load and store | 6 | 3 |
| Branch | 6 | 5 |
| Others | 8 | 4 |

Assume that "Arithmetic and logic" instructions can be modified so that they take 5 cycle per instruction instead of 8 as in the table. Compute the speedup obtained by introducing this enhancement using the Amdhal law.

How many cycles should "Branch" instructions consist of to reach at least the same speedup obtained modifying the number of cycles of "Arithmetic and logic" instructions as above?

## Exercise 5 (3 points) - Number representation

Given the values $A=1100001011$ and $B=0010000011$ in the $R B$ representation, convert them in decimal.

Show the execution of operation $A+B$. Verify the value of the results.

## Exercise 6 (3 points) - Number representation

- Determine two ways to choose the moduli set for using the residue number system to represent values in the number range [0; 359], considering a moduli set consisting of $\mathbf{3}$ moduli and a moduli set consisting of $\mathbf{4}$ moduli.
- Compare the two different choices with respect to the number of bits necessary for the representation, and consider also the number of bits needed for representing the range [0;359] with the conventional binary system.

## Exercise 7 (4 points) - Arithmetic circuit time and area

Explain the difference between a pipelined multiplier for unsigned and signed binary values and compare the area required by the two multipliers.
