

# Lego SPIKE

Andrea Sterbini – [sterbini@di.uniroma1.it](mailto:sterbini@di.uniroma1.it)

## Lego SPIKE HUBs

2 kits with Bluetooth, BLE and USB connectivity and with an internal 6 axis gyro+accel sensor

- “Prime” large HUB has SIX I/O ports, 3 motors, colour / force / distance sensors, 4 buttons, 5x5 led matrix, speaker
- “Essential” small HUB has only TWO I/O ports and a single led/button

Ports are bi-directional Low-power at 115 Khz

MicroPython OS on 100MHz Arm Cortex-M4 CPU with 320KB RAM 1M FLASH, leaving 32M RAM available for programs/data

# Sensors and devices

Distance sensor

3x3 light (Essential)

Force sensor

Colour sensor

Motors (sensor)

(Essentials)

Internal Gyro sensor

# IDE apps both for pre-scholar and scholar

Programming IDE for iPad, MacOS, Win, Android

Scratch-inspired Word Blocks or Icon Blocks languages

Transforms visual programs to Python

Deploys the program on the robot

Runs the program on the robot and shows the robot display

4 combinations of IDE:

- 2 kit-related versions (Prime vs Essentials)
- 2 visual versions of the blocks (pre-scholars IconBlocks vs text-based WordBlocks)
- plus a python mode in previous legacy app v.2 (planned for v.3)

# Icon Blocks

## pre-scholar language ScratchJr inspired

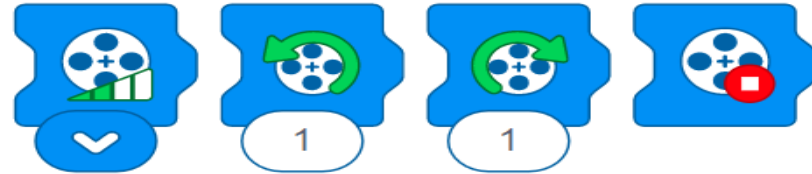

### EVENTS

sensor-based  
message-based

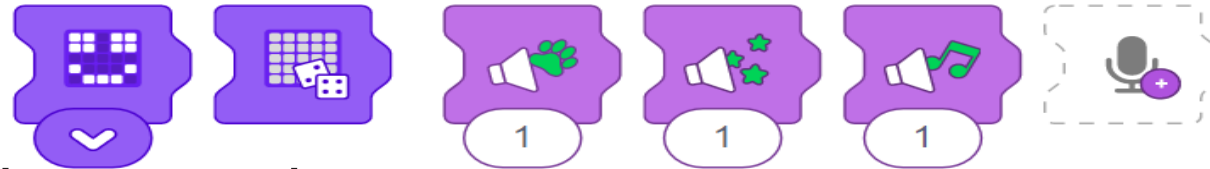

### SINGLE MOTOR MOTION

set speed/turn left/turn right/stop

### DISPLAY and SOUNDS

show picture/random pixels  
8 animal/8 effects/8 music/record a new sound

### CONTROL:

wait/repeat/forever/end

# Extensions

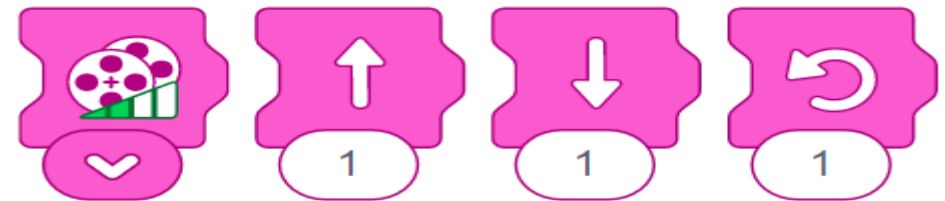

DISPLAY (shown in the APP):  
show text/show image/show fullscreen

BAR-CHARTS (shown in the APP):  
add a value to the bar-chart (6 colors)  
clear bar-chart  
show fullscreen

DIFFERENTIAL MOVEMENT:  
set speed/forward/back/turn

## Icon Block language: ScratchJr – Agents + Robotics

New Functions?	NO	cannot define new blocks
Recursion?	NO	
Return?	NO	
Loops?	PARTIAL	only counted loop or forever
Conditionals?	NO	
Messages?	YES	send 6 colors or a random color
Events?	YES	sensor or message-based
Concurrency?	YES	multiple event definitions
Agents?	<u>NO!!!</u>	

# Word Block language: Scratch + Robotics

## Single motor

### Motors

A collection of blue Scratch-style word blocks for controlling a single motor. The blocks include: 'A' run for 1 rotation, 'A' go shortest path to position, 'A' start motor, 'A' stop motor, 'A' set speed to 75 %, 'A' position, and 'A' speed.

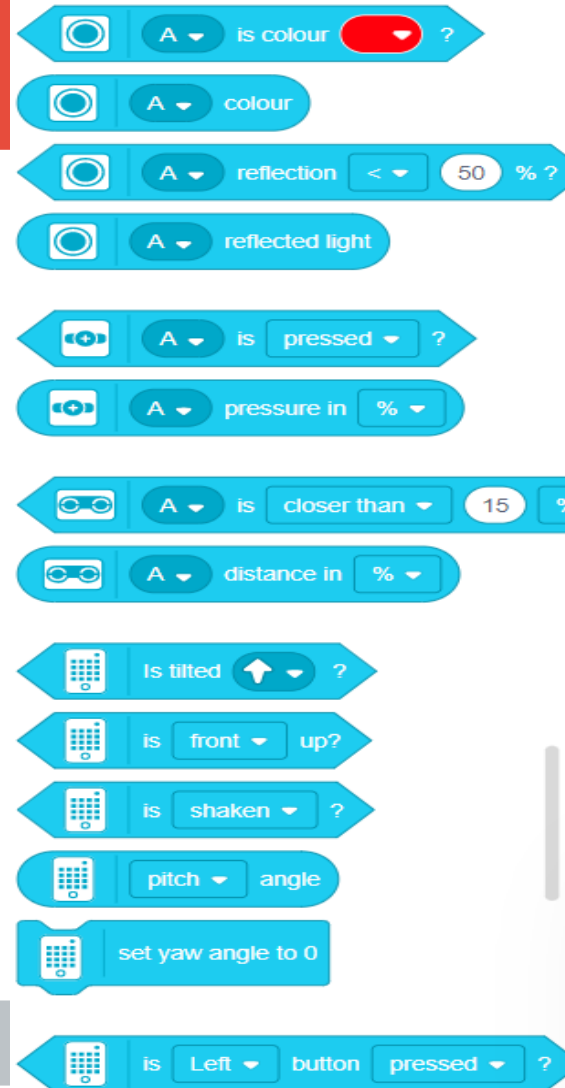

## Differential drive

### Movement

A collection of pink Scratch-style word blocks for differential drive movement. The blocks include: 'move' up for 10 rotations, 'start moving' up, 'move' right: 30 for 10 rotations, 'start moving' right: 30, 'stop moving', 'set movement speed to' 50 %, 'set movement motors to' A+B, and 'set 1 motor rotation to' 17.5 cm.

## Sensors

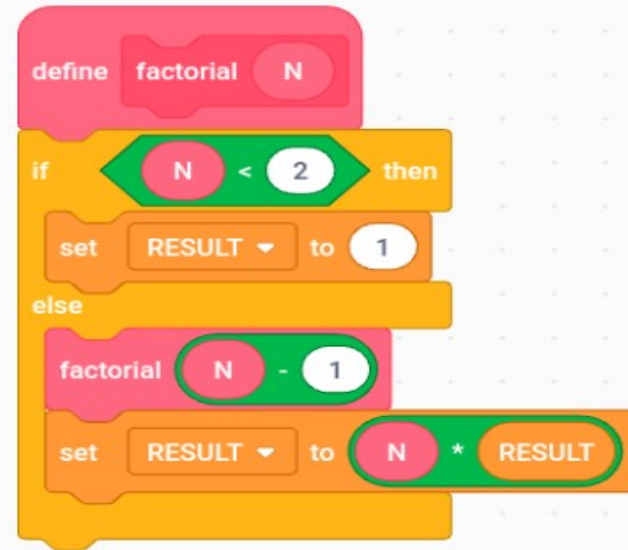

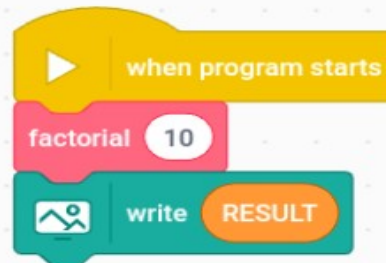

A collection of blue Scratch-style word blocks for various sensors. The blocks include: 'A' is colour red, 'A' colour, 'A' reflection < 50 % ?, 'A' reflected light, 'A' is pressed, 'A' pressure in %, 'A' is closer than 15 %, 'A' distance in %, 'Is tilted' up, 'is front up?', 'is shaken', 'pitch angle', 'set yaw angle to 0', and 'is Left button pressed'.

Methods in Computer Science

# Word Block language:

## Scratch - Agents + Robotic blocks

New Functions?	ONLY PROCEDURES
Recursion?	YES
Return?	NO (you can use globals)
Events?	YES
Local variables?	<u>NO!</u> (only globals)
Messages?	YES (named, no args, you can use globals)
<u>Concurrency?</u>	<u>YES</u> (multiple event defs)
<u>Agents?</u>	<u>NO!!!</u>
<u>Clones?</u>	<u>NO!!!</u>

# Events and messages

Sensor based events (when sensor CHANGES):

When colour is

When pressure is

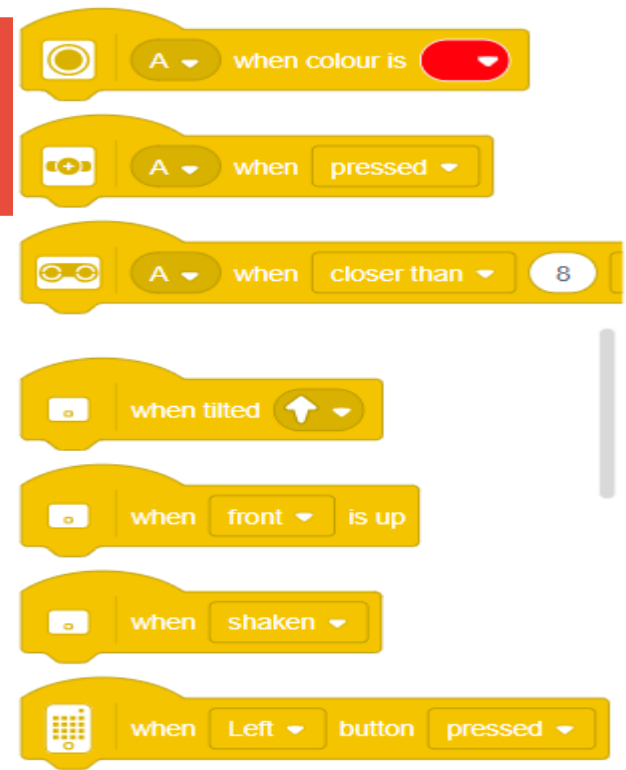

When distance closer than

When tilted/positioned/shaken

When button is presseded/released

Timer and polling events

Message-based events  
and synchronization

# (Micro)Python mode in SPIKE App

Single thread of execution (?)

Each sensor, Hub and App is represented by a class

Events are simulated by waits (wait\_\_until\_\_XXX methods)

Simple types: int, float, str, list

```
from spike import PrimeHub, LightMatrix, Button, StatusLight,  
from spike import ForceSensor, MotionSensor, Speaker, ColorSensor  
from spike import App, DistanceSensor, Motor, MotorPair  
from spike.control import wait_for_seconds, wait_until, Timer  
from math import *
```

```
hub = PrimeHub()
```

```
hub.light_matrix.show_image('HAPPY')
```

# **CALLBACKS → how to manage async events**

**(see [Lego HUB docs](#) or [MicroPython docs](#))**

<code>hub.button.Button.callback()</code>	when the button is pressed
<code>hub.bluetooth.lwp_monitor()</code>	when a BT connection is ready
<code>hub.display.callback()</code>	when a display operation is completed/interrupted
<code>hub.motion.orientation()</code>	when HUB changes orientation top/bottom/front/back/left/right
<code>hub.motion.gesture()</code>	when HUB is shaken/tapped/falls
<code>hub.sound.callback()</code>	when a sound is completed/interrupted
<code>hub.supervision.callback()</code>	when an over-current event happens
<code>hub.BT_VCP.callback()</code>	when BT connection changes in a virtual data stream connection
<code>hub.Port.callback()</code>	when a device is plugged/unplugged from the port
<code>hub.Motor.callback()</code>	when a command is completed/interrupted/stalled
<code>hub.MotorPair.callback()</code>	when a command is completed/interrupted/stalled

# More sensors!!!

The LPF2 connection specs allow using other sensors, e.g. from [MindSensors.com](https://www.mindsensors.com)

- Temperature (contact or infrared)

- Infrared Motor controller

- RFID tag reader

- dual zone infrared distance

- adapter for EV3 sensors (compass, vision, camera, etc...)

# More ways to program Lego SPIKE!!!

Other Python-based firmware is available

See for example <https://pybricks.com> compatible with:

- Lego Technic/Inventor/Boost/Spike
- Lego Mindstorms EV3
