Multimodal Interaction

Lesson 4 Designing Interaction

Maria De Marsico demarsico@di.uniroma1.it

Maria De Marsico - demarsico@di.uniroma1.it

Dialog Design

- User models (difficult)
 - o Cognitive models
 - o Task models
- Technology models (easy)
- Sentence models (dialog sentences) to produce

Maria De Marsico - demarsico@di.uniroma1.it

Hierarchies of goals and tasks

- Abstraction of internal user models
- Mental processing as divide-and-conquer
- Example: produce a selling report

produce report gather data

- . find book names
- . . do keywords search of names database
- further sub-goals
- . . sift through names and abstracts by hand
- further sub-goals
- . search sales database further sub-goals layout tables and histograms - further sub-goals write description - further sub-goals

Maria De Marsico - demarsico@di.uniroma1.it

3

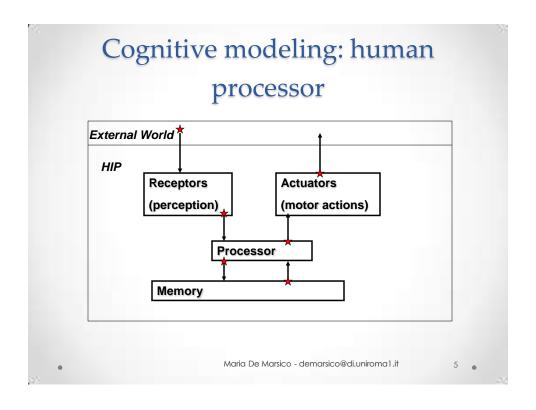

Goals vs. tasks

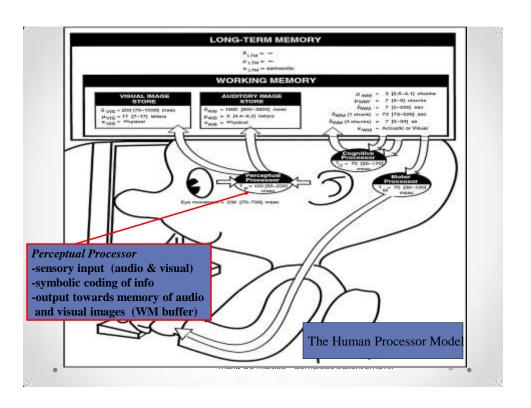

- goals intentions
 - What one would want
- tasks actions

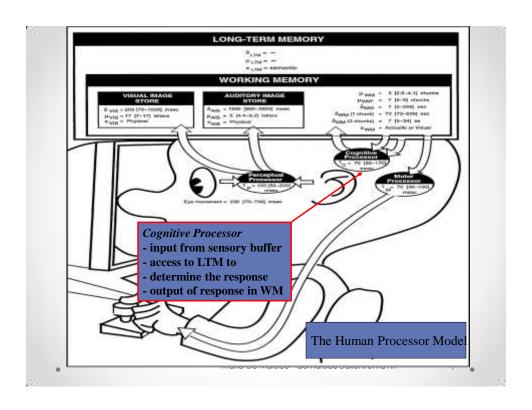

How to obtain it

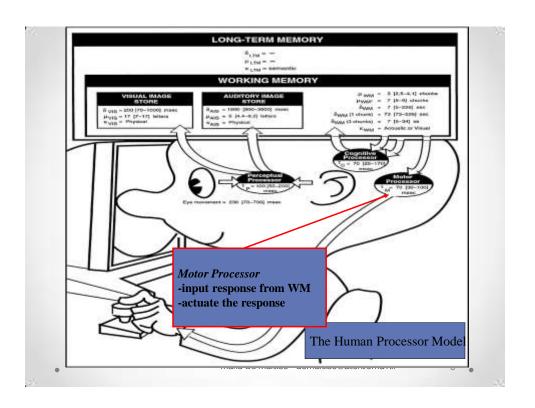

- GOMS internal goals
- HTA external actions
 - tasks are abstractions

Maria De Marsico - demarsico@di.uniroma1.it

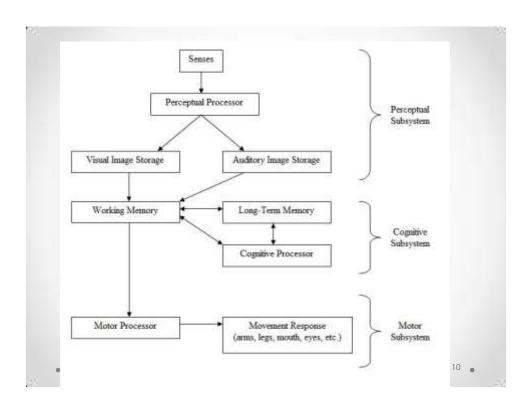

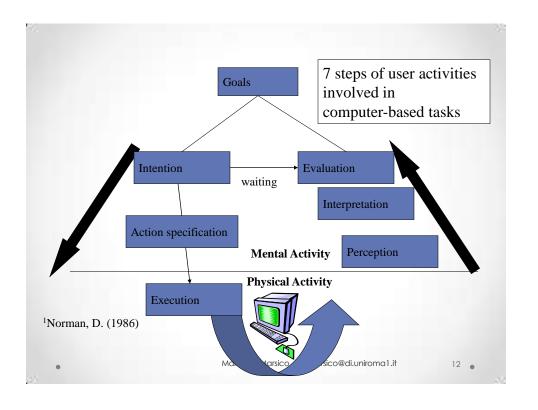

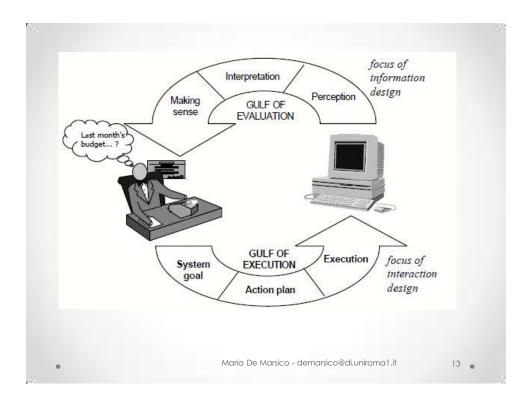

Parameter	Mean	Range
Eye movement time	230 ms	70-700 ms
Decay half-life of visual image storage	200 ms	90-1000 ms
Visual Capacity	17 letters	7-17 letters
Decay half-life of auditory storage	1500 ms	90-3500 ms
Auditory Capacity	5 letters	4.4-6.2 letters
Perceptual processor cycle time	100 ms	50-200 ms
Cognitive processor cycle time	70 ms	25-170 ms
Motor processor cycle time	70 ms	30-100 ms
Effective working memory capacity	7 chunks	5-9 chunks
Pure working memory capacity	3 chunks	2.5-4.2 chunks
Decay half-life of working memory	7 sec	5-226 sec
Decay half-life of 1 chunk working memory	73 sec	73-226 sec
Decay half-life of 3 chunks working memory	7 sec	5-34 sec

Norman Stages of action • We start with a goal • Real tasks are defined in an imprecise way • We must do something: execution • intentions: low level statements to define what we need to do • sequence of actions • execution • We verify il goal was achieved • perception of what happened • interpretation of what happened • evaluation of correspondence with goals

Norman's cycle revisited

- In the case of multimodal interactive cycles, Norman's model of interaction may be reformulated as follows:
- 1. Establishing the goal.
- 2. Forming the intention.
- 3. Specifying the **multimodal** action sequence in terms of **human output modalities**.
- 4. Executing the **multimodal** action.
- 5. Perceiving the system state in terms of **human input modalities**.
- 6. Interpreting the system state.
- 7. Evaluating the system state with respect to the goals and the intentions.

From goal to intention

- <u>Establishing the goal</u>: is, as usual, the stage when the user determines what needs to be done in the given domain, in terms of a **suitable task language**
- Forming the intention: at this stage the goal is translated into more precise user's intention, which will help the user determining the right sequence of actions that should be performed to achieve the goal

Maria De Marsico - demarsico@di.uniroma1.it

Action plan

Specifying the multimodal action sequence: the sequence of actions performed to accomplish the required task should be precisely stated at this stage.

Complexity of multimodal interaction appears for the first time in the cycle. Each multimodal action can be specified in terms of:

1. <u>Complementary human output sensory modalities</u> (i.e., multiple utterances at once form the action)

and/or

2. Alternative human output sensory modalities (i.e., alternative, redundant utterances for the same action).

Some **unintentional** utterances: blood pressure, temperature, heartbeat, excretion, etc.

A user may move an object in the interaction scene by speaking and pointing at (gesturing) the new object location (complementary modalities).

Then, instead of gesturing (s)he may want to gaze at the new location on the interface where the object should be moved (alternative modality).

Execution

Executing each multimodal action: at this stage, each human modality used to specify an action is translated into corresponding interaction modes.

Each action is executed through

1. Complementary modes

or

2. Alternative modes

Text, speech, Braille, mimicking, eye/motion capture, haptics, bio-electrical sensoring are examples of modes used to translate human output modalities into the system input language.

When the execution of the whole sequence of multimodal actions is complete, the system reaches a new state and communicates it to the user again exploiting (possibly multiple) interaction modes, such as speech synthesis, display, haptic/tactile feedback, smell rendering and so on.

Maria De Marsico - demarsico@di.uniroma1.it

Perception

<u>Perceiving the system state</u>: at this stage, the evaluation phase of the cycle begins.

Depending on the combination of system output modes, the user may perceive the new state through multiple input sensory modalities, such as visual, auditory, tactile, and (in some revolutionary interfaces) even smelling and tasting.

Interpretation and Evaluation

- Interpreting the system state: here the user is supposed to interpret the output of her/his sequence of actions to evaluate what has happened.
- Evaluating the system state with respect to the goals and the intentions: at the final stage, the user compares the new system state with her/his expectations, to evaluate if the initial goal has been effectively reached.

Maria De Marsico - demarsico@di.uniroma1.it

Goal hierarchies

- Granularity
 - o Where to start from?
 - o Where to stop?
- · Routine tasks vs. problem solving
 - Unit tasks
- Conflict
 - o Different ways to reach a goal
- Errors

Maria De Marsico - demarsico@di.uniroma1.it

Tecniques

- Goals, Operators, Methods and Selection (GOMS) [Card, Moran, Newell 1983]
- Cognitive Complexity Theory (CCT) [Kieras & Polson 1990 (basata su GOMS)]
- Hierarchical Task Analysis (HTA) [Shepherd tardi anni '60]

Maria De Marsico - demarsico@di.uniroma1.it

21

GOMS

Goals

o what the user wants to obtain

Operators

o base actions executed by the user

Methods

o decompose goals in sub-goals / operators

Selection

o ways to choose among alternative methods

Maria De Marsico - demarsico@di.uniroma1.it

22 •

Example GOMS GOAL: CLOSE-WINDOW . [select GOAL: USE-MENU-METHOD . MOVE-MOUSE-TO-FILE-MENU . PULL-DOWN-FILE-MENU . CLICK-OVER-CLOSE-OPTION GOAL: USE-CTRL-W-METHOD . PRESS-CONTROL-W-KEYS] For a particular user: Rule 1: Select USE-MENU-METHOD unless another rule applies Rule 2: If the application is GAME, select CTRL-W-METHOD

Maria De Marsico - demarsico@di.uniroma1.it

Action Language Reisner (1983) "Psychological BNF" • The analysis is focused on user's behaviour and communication • Attention for human knowledge and knowledge sources

Cognitive complexity theory (CCT)

Kieras & Polson 1990 (based on GOMS)

- Based on a model of information processing by human user
- Production rules:
 - Learned and stored in Long Term Memory (LTM)
 - Used during interaction with computer, through processes activated from Working Memory (WM)

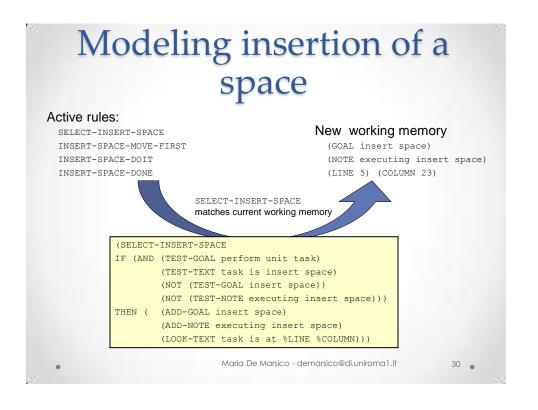

Maria De Marsico - demarsico@di.uniroma1.it

Cognitive Complexity Theory (CCT) Two parallel descriptions: User production Rules Generalised Transition Networks for the device Production rules: if condition then action

Maria De Marsico - demarsico@di.uniroma1.it

Cognitive complexity theory (CCT) Production rules in in LTM: if (condition) then (action) condition: test on the content of WM action: transforms the content of WM towards an activity If more rules can be alpplied: priority rule Complexity: number of production rules in LTM: index of learnability number of cycles in WM: index of ease of use number of shared productions for 2 systems: index of transferrability Maria De Marsico - demarsico@di.uniroma1.it 28

Example: editing with vi Production rules in LTM WM modeled as attribute-value associations: (GOAL perform unit task) (TEXT task is insert space) (TEXT task is at 5 23) (CURSOR 8 7) Rules matched with WM LOOK-TEXT task is at %LINE %COLUMN is true, with LINE = 5 COLUMN = 23.

Notes on CCT Parallel Model Actions are expressed as procedures Different rules for experts and novices Possible to represent error Measures Depth of goal structure Number of di rules Maria De Marsico - demarsico@di.uniroma1.it

Problems with goal hyerarchies Post hoc technique Experts versus novices How cognitive they are?

Linguistic Notations

- Try to understand user's behaviour and cognitive difficulties according to the analysis of the language between user and system
- Backus-Naur Form (BNF)
- Task–Action Grammar (TAG)

Maria De Marsico - demarsico@di.uniroma1.it

33

Backus-Naur Form (BNF)

- Computer Science Notation
- Dialog is considered from a purely syntactic point of view
- Terminals(symbols)
 - lower level of user behaviour e.g. CLICK-MOUSE, MOVE-MOUSE
- Non-terminals
 - terminal ordering
 - higher level of abstraction e.g. select-menu, position-mouse

Maria De Marsico - demarsico@di.uniroma1.it

Esempio di BNF

- Basic syntax:
 - o nonterminal ::= expression
- Expression
 - o Includes both terminals and non-terminals
 - Combined in sequence (+) or as alternatives (|)

```
draw line ::= select line + choose points + last point
select line ::= pos mouse + CLICK MOUSE
choose points ::= choose one | choose one + choose points
choose one ::= pos mouse + CLICK MOUSE
last point ::= pos mouse + DBL CLICK MOUSE
pos mouse ::= NULL | MOVE MOUSE+ pos mouse

Maria De Marsico - demarsico@di.uniroma1.it 35
```

Measures for BNF

- Number of rules
- Number of +e | operators
- Problems
 - same syntax for different semantics
 - o no reflections on perception
 - low consistency control

Maria De Marsico - demarsico@di.uniroma1.it

Task Action Grammar (TAG)

- Consistence made explicit
- Code user knowledge
- Grammar rules are parametrized
- Non-terminals are modified to include semantics

Maria De Marsico - demarsico@di.uniroma1.it

37

Consistency in TAG

In BNF, 3 UNIX commands are described as:

copy ::= cp + filename + filename | cp + filenames + directory

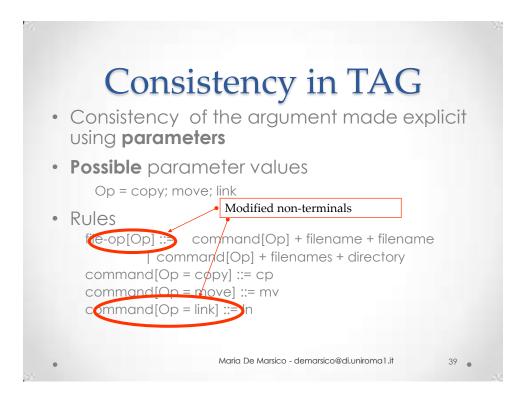

move ::= mv + filename + filename | mv + filenames + directory

link ::= In + filename + filename | In + filenames + directory

 No measure would distinguish a less consistent grammar where:

link::= In + filename + filename | In + directory + filenames

Maria De Marsico - demarsico@di.uniroma1.it

Task Analysis Methods per analyze user tasks: What they do What they are working with What they have to know

Example • To clean house • get the vacuum cleaner out • fix the appropriate attachments • clean the rooms • when the dust bag gets full, empty it • put the vacuum cleaner and tools away • Need to know about: • vacuum cleaners, their attachments, dust bags, cupboards, rooms etc.

Approaches to task analysis

- Task decomposition
 - Sub-tasks ordered both temporally and casually
- Knowledge-based techniques
 - o User knowledge about task and its organization e
- Analysis based on entitis/objects
 - Relations among objects, actions, and users performing them

Maria De Marsico - demarsico@di.uniroma1.it

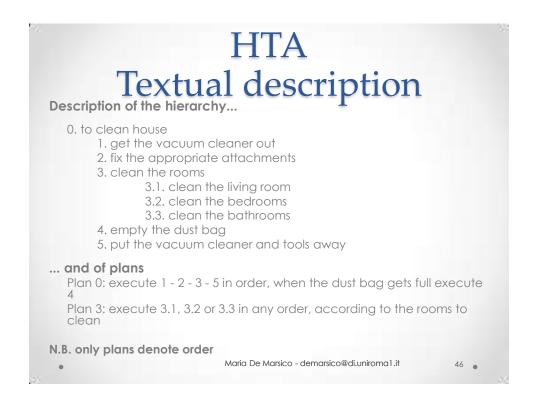

43

General method

- To observe
- To gather lists of keywords and actions
- To organize them using notations and/or diagrams

Maria De Marsico - demarsico@di.uniroma1.it

Decomposition into tasks Aim: To describe the actions performed by users that have to interact with the system Structure them in a hierarchy of tasks and subtasks To describe the order of sub-tasks Variations: Hierarchical Task Analysis (HTA) more widespread CTT (CNUCE, Pisa) uses temporal operators from LOTOS

How to generate the hierarchy

- I Get the list of tasks
- 2 Group tasks in higher level tasks
- 3 Further decompose lower level tasks Stop rules

How to know when to stop?

A task like "empty the dust bag" is easy enough?

Aim: to expand only relevant tasks

Motor actions: lower reasonable level

Maria De Marsico - demarsico@di.uniroma1.it

17

Note

- · Asking:
 - what are you doing?
- One could get answers:

I'm typing ctrl-B

I'm making a word become bold

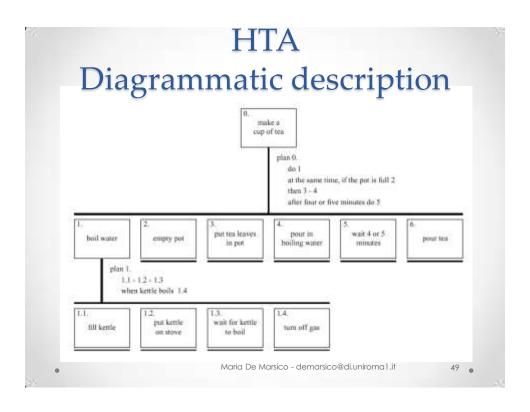

I'm emphasizing a word

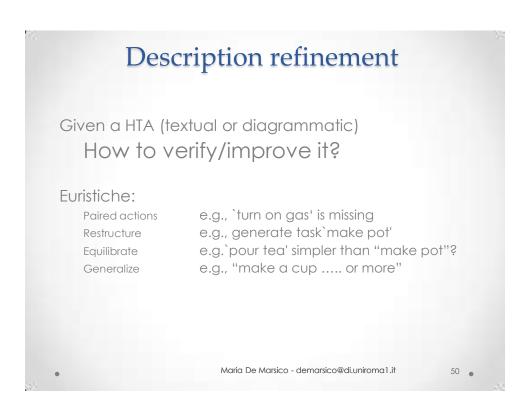

I'm editing a document

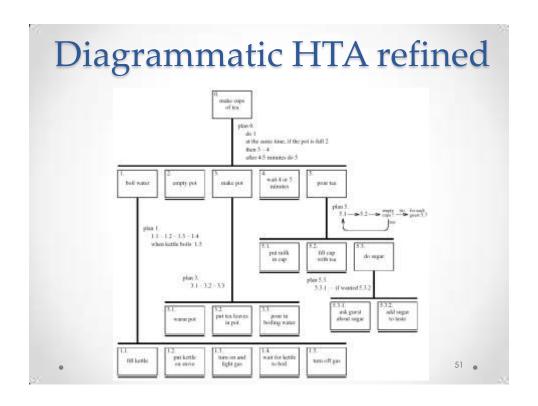

I'm writing a letter

I'm working on a legal practice

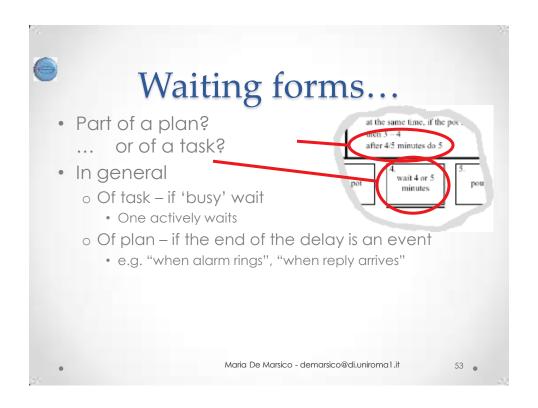

Maria De Marsico - demarsico@di.uniroma1.it

	Opera	tor	s I	
Independent Concurrency (T1 II T2)	Actions belonging to two tasks can be performed in any order without any specific constraints, for example monitoring a screen and speaking in a microphone;	Describation (T1 (> T2)	The first tack is definitively described of once the first action of the second tack has been performed. This concept is often used in many user interface implementations when the user can describe the option of performing a set of tacks and enable a	
Choice (T1 [] T2)	It is possible to choose from a set of tasks and, once the choice has been made the task chosen can		new set of possible task accomplishments by a specific action (for example by selecting a button).	
be performed and other tasks are not available at least until it has been terminated. This operator is useful in the design of user interfaces because it is often important to enable the user to choose from various tasks. An example is, at the beginning of a word processor session when it is possible to choose whether to open an entiting fille or a new one. Also the system can choose to perform one task from a set of application tasks depending on its current state.	Freshing (TI >> TZ)	In this case one task enables a second one when it terminutes, for example, a database where users have first to register and then they can interact with the data.		
	Enabling with information passing (T1 []>> T2)	In this case task T1 provides some information to task T2 other than enabling it. For example, T1 allows the user to specify a query and T2 provides the query result that obviously depends on the information generated by T1		
Concurrency with information exchange (T18 T2)	It's current state. Two tasks can be executed concurrently but they have to synchronise in order to exchange information. For example, a word processor application where editing a file and soro ling its contents can be performed in any order and they exchange information when they are performed because it is possible to edit only the information that the scrolling has made visible.	Superd- resume (TI P T2)	This operator gives 12 the possibility of interrupting II and then when II is terminated, II can be reactivated from the state reached before the interruption. For example, the editing text tack which, in some applications can be supersided by a modal printing tack, and more the printing tack is accomplished then editing can be carried on from the state reached beforehand. For example, this operator can be used to model a type	

of interruption

Maria De Marsico - demarsico@di.uniroma1.it

Operatori II In the tasks specification we can have some tasks Beration with the *symbol next to their name. This means that the tasks are performed repetitively: when they terminate, the performance of their actions automatically starts to be executed again from the beginning. This continues until the task is deactivated by another task. It is used when designers know in advance how many times a task will be performed. Finite Beration (Tl(h)) They give the possibility of indicating that the performance of a task is optional. Optional tasks Optional tasks ([T]) are indicated in square brackets. For example, we have optional tasks when we fill a form in and there are some fields that are mandatory and others optional. Recursion This means that in the subtree originated by the task considered there is another occurrence of it. This possibility is used, for example, with tasks that, for each recursion, allows performance of the recursive tasks with the additional possibility of performing some new tasks, until a task interrupting the recursion is performed. 58 Maria De Marsico - demarsico@di.uniroma1.it
