

# Chapter 8 roadmap

8.1 What is network security?

8.2 Principles of cryptography

8.3 *Message integrity*, authentication

8.4 Securing e-mail

8.5 Securing TCP connections: SSL

8.6 Network layer security: IPsec

8.7 Securing wireless LANs

8.8 Operational security: firewalls and IDS

# Digital signatures

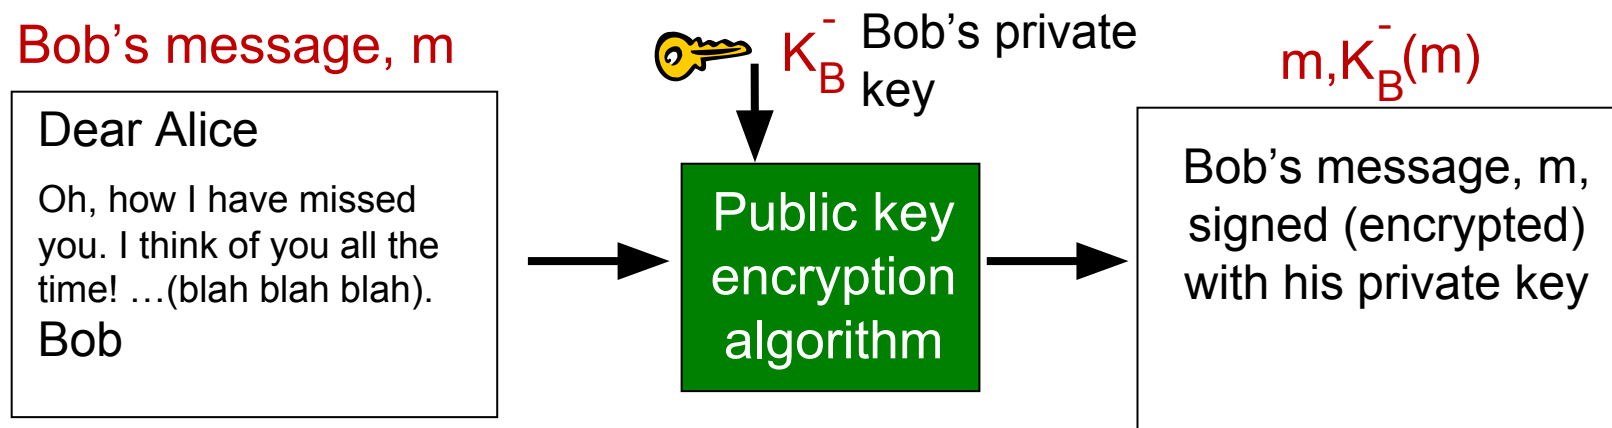

cryptographic technique analogous to hand-written signatures:

- ❖ sender (Bob) digitally signs document, establishing he is document owner/creator.
- ❖ *verifiable, nonforgeable*: recipient (Alice) can prove to someone that Bob, and no one else (including Alice), must have signed document

# Digital signatures

## simple digital signature for message $m$ :

- ❖ Bob signs  $m$  by encrypting with his private key  $\bar{K}_B$ , creating “signed” message,  $\bar{K}_B(m)$

# Digital signatures

- ❖ suppose Alice receives msg  $m$ , with signature:  $m, K_B^-(m)$
- ❖ Alice verifies  $m$  signed by Bob by applying Bob's public key  $K_B^+$  to  $K_B^-(m)$  then checks  $K_B^+(K_B^-(m)) = m$ .
- ❖ If  $K_B^+(K_B^-(m)) = m$ , whoever signed  $m$  must have used Bob's private key.

## Alice thus verifies that:

- Bob signed  $m$
- no one else signed  $m$
- Bob signed  $m$  and not  $m'$

## non-repudiation:

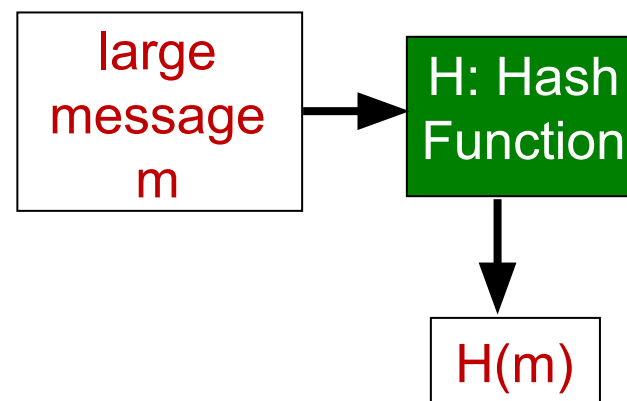

- Alice can take  $m$ , and signature  $K_B^-(m)$  to court and prove that Bob signed  $m$

# Message digests

computationally expensive  
to public-key-encrypt  
long messages

*goal:* fixed-length, easy- to-  
compute digital  
“fingerprint”

- ❖ apply hash function  $H$  to  $m$ , get fixed size message digest,  $H(m)$ .

**Hash function properties:**

- ❖ many-to-1
- ❖ produces fixed-size msg digest (fingerprint)
- ❖ given message digest  $x$ , computationally infeasible to find  $m$  such that  $x = H(m)$

# Internet checksum: poor crypto hash function

Internet checksum has some properties of hash function:

- produces fixed length digest (16-bit sum) of message
- is many-to-one

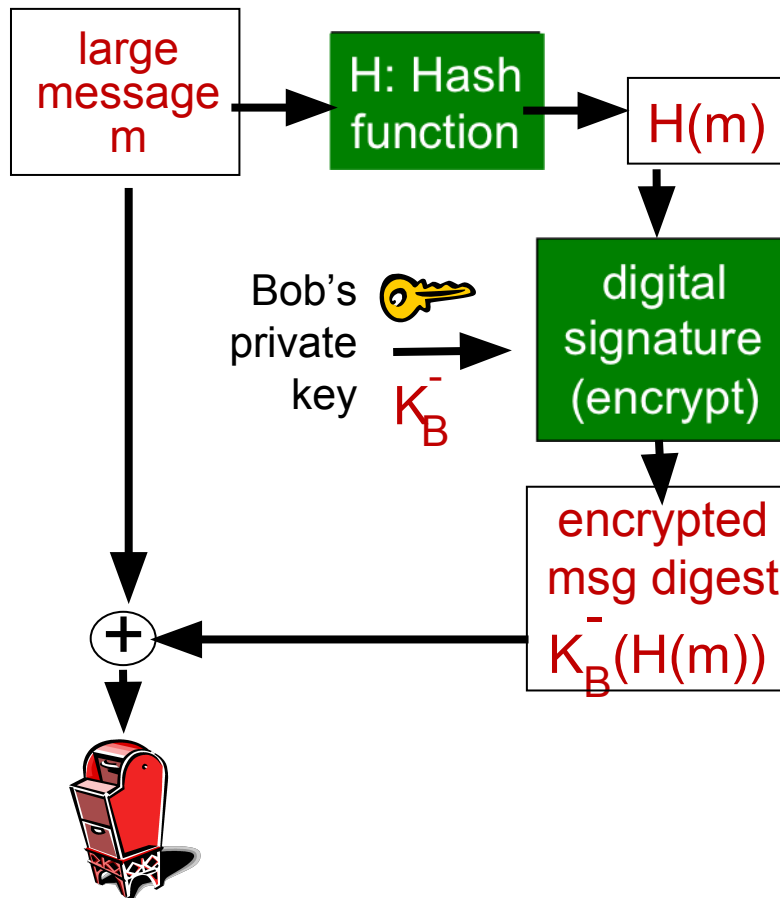

But given message with given hash value, it is easy to find another message with same hash value:

<u>message</u>	<u>ASCII format</u>	<u>message</u>	<u>ASCII format</u>
I O U 1	49 4F 55 31	I O U <u>9</u>	49 4F 55 <u>39</u>
0 0 . 9	30 30 2E 39	0 0 . <u>1</u>	30 30 2E <u>31</u>
9 B O B	39 42 D2 42	9 B O B	39 42 D2 42
<hr/>		<hr/>	
B2 C1 D2 AC			B2 C1 D2 AC

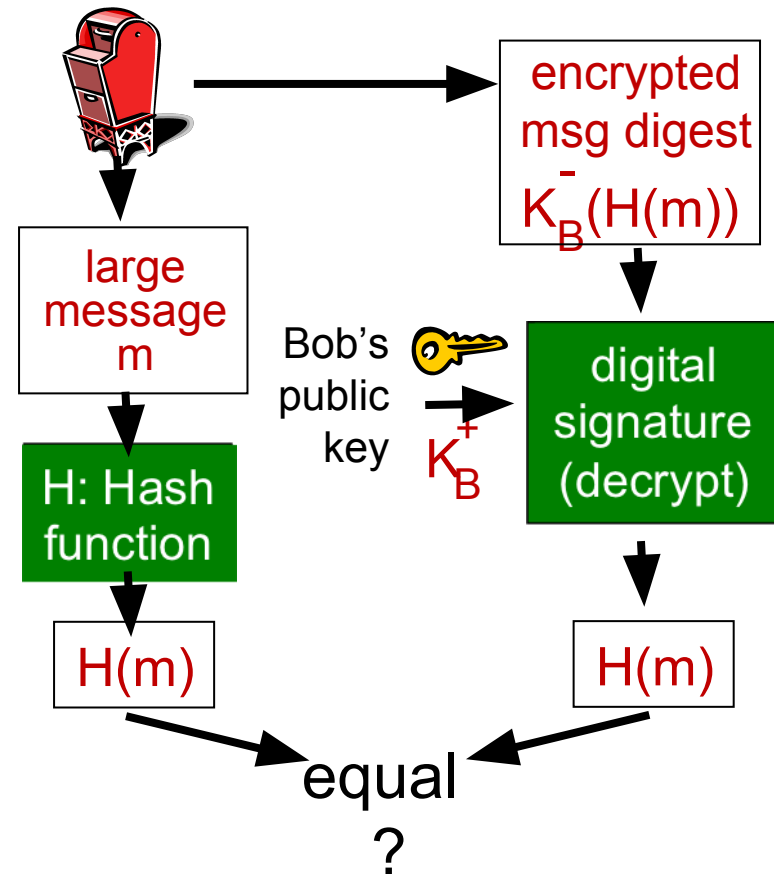

different messages  
but identical checksums!

# Digital signature = signed message digest

Bob sends digitally signed message:

Alice verifies signature, integrity of digitally signed message:

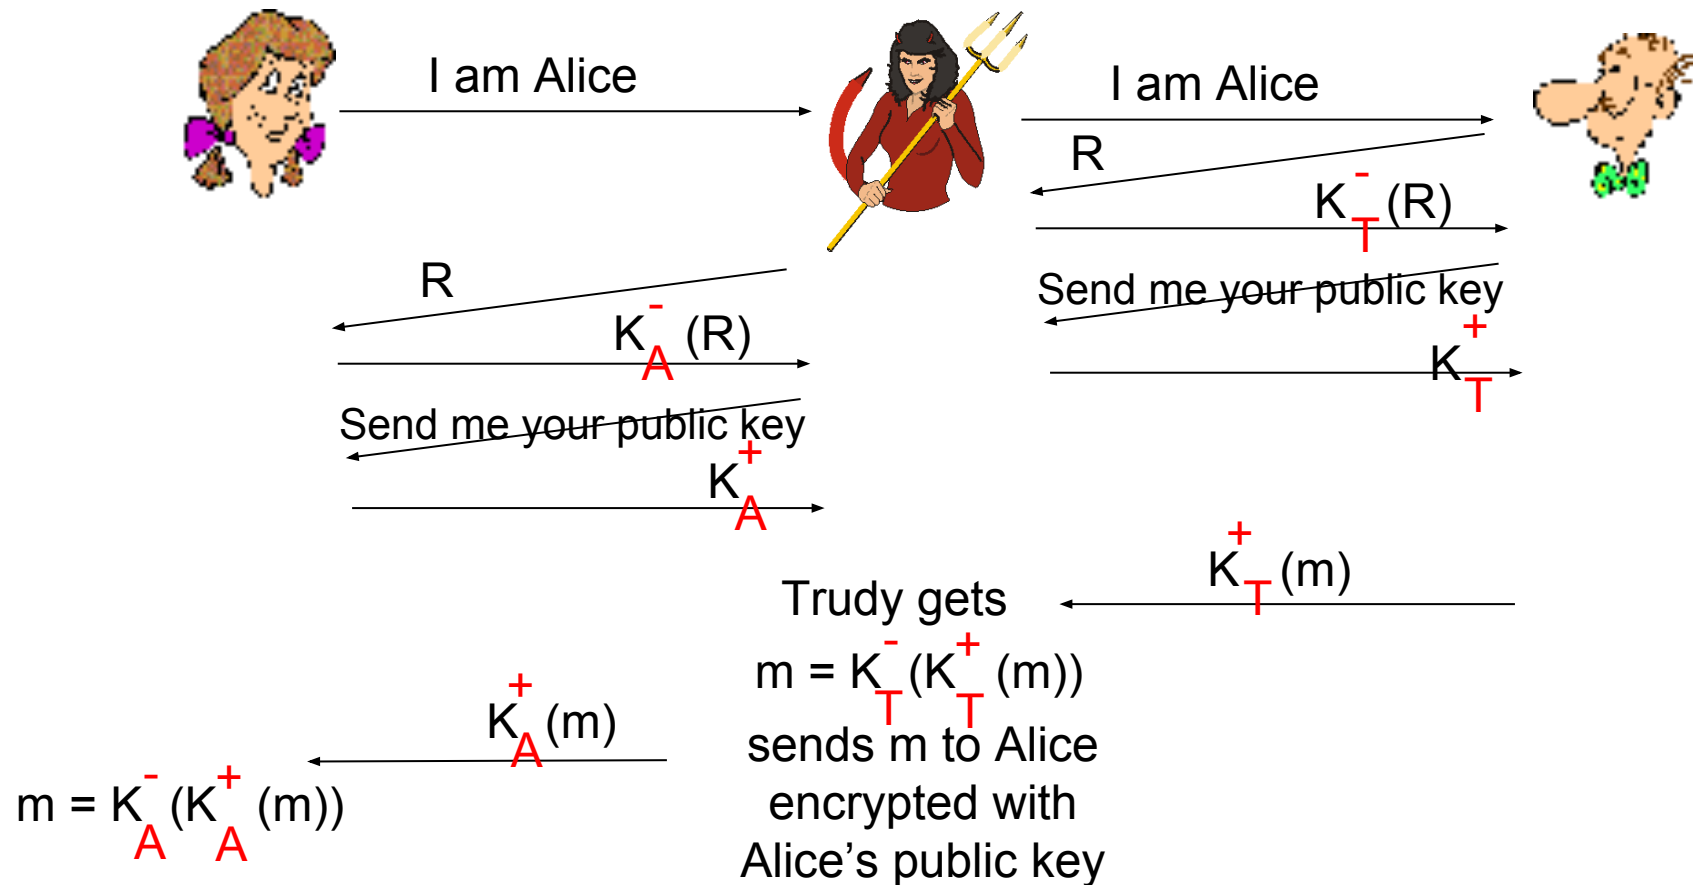

# Hash function algorithms

- ❖ **MD5 hash function widely used (RFC 1321)**
  - computes 128-bit message digest in 4-step process.
  - arbitrary 128-bit string  $x$ , appears difficult to construct msg  $m$  whose MD5 hash is equal to  $x$
- ❖ **SHA-1 is also used**
  - US standard [NIST, FIPS PUB 180-1]
  - 160-bit message digest

# Recall: ap5.0 security hole

*man (or woman) in the middle attack:* Eve poses as Alice (to Bob) and as Bob (to Alice)

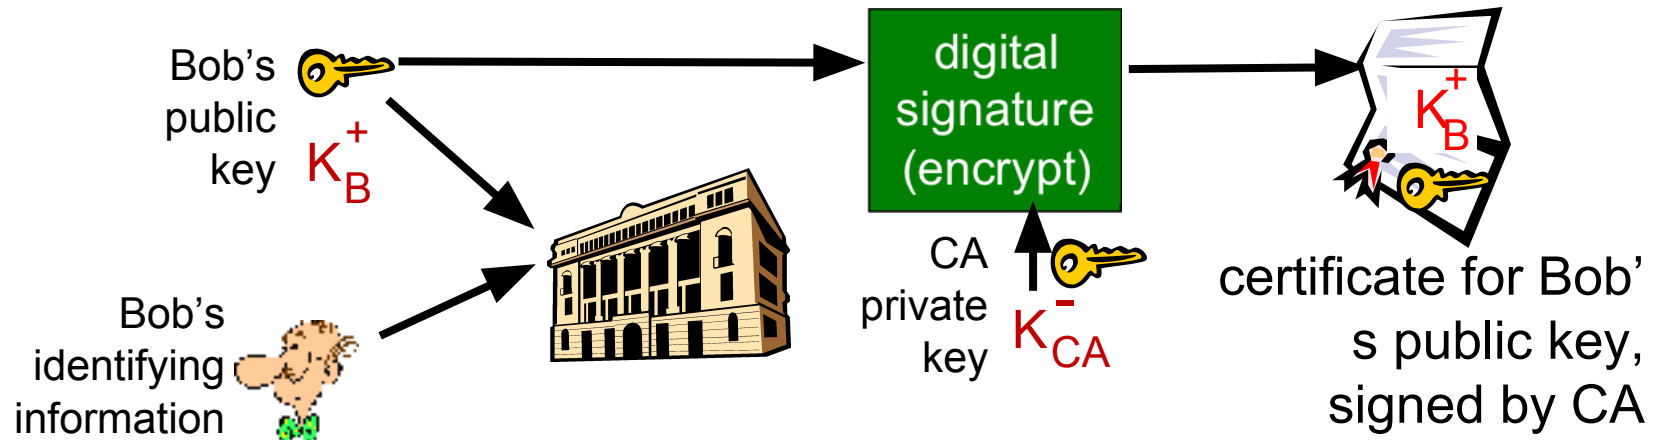

# Public-key certification

- ❖ motivation: Eve plays pizza prank on Bob
  - Eve creates e-mail order:  
*Dear Pizza Store, Please deliver to me four pepperoni pizzas. Thank you, Bob*
  - Eve signs order with her private key
  - Eve sends order to Pizza Store
  - Eve sends to Pizza Store her public key, but says it's Bob's public key
  - Pizza Store verifies signature; then delivers four pepperoni pizzas to Bob
  - Bob doesn't even like pepperoni

# Certification authorities

- ❖ *certification authority (CA)*: binds public key to particular entity, E.
- ❖ E (person, router) registers its public key with CA.
  - E provides “proof of identity” to CA.
  - CA creates certificate binding E to its public key.
  - certificate containing E’s public key digitally signed by CA – CA says “this is E’s public key”

# Certification authorities

- ❖ when Alice wants Bob's public key:
  - gets Bob's certificate (Bob or elsewhere).
  - apply CA's public key to Bob's certificate, get Bob's public key

# Chapter 8 roadmap

8.1 What is network security?

8.2 Principles of cryptography

8.3 Message integrity, authentication

*8.4 Securing e-mail*

8.5 Securing TCP connections: SSL

8.6 Network layer security: IPsec

8.7 Securing wireless LANs

8.8 Operational security: firewalls and IDS

# Secure e-mail

- ❖ Alice wants to send confidential e-mail,  $m$ , to Bob.

## Alice:

- ❖ generates random *symmetric* private key,  $K_S$
- ❖ encrypts message with  $K_S$  (for efficiency)
- ❖ also encrypts  $K_S$  with Bob's public key
- ❖ sends both  $K_S(m)$  and  $K_B^+(K_S)$  to Bob

# Secure e-mail

- ❖ Alice wants to send confidential e-mail,  $m$ , to Bob.

**Bob:**

- ❖ uses his private key to decrypt and recover  $K_S$
- ❖ uses  $K_S$  to decrypt  $K_S(m)$  to recover  $m$

# Secure e-mail (continued)

- ❖ Alice wants to provide sender authentication message integrity

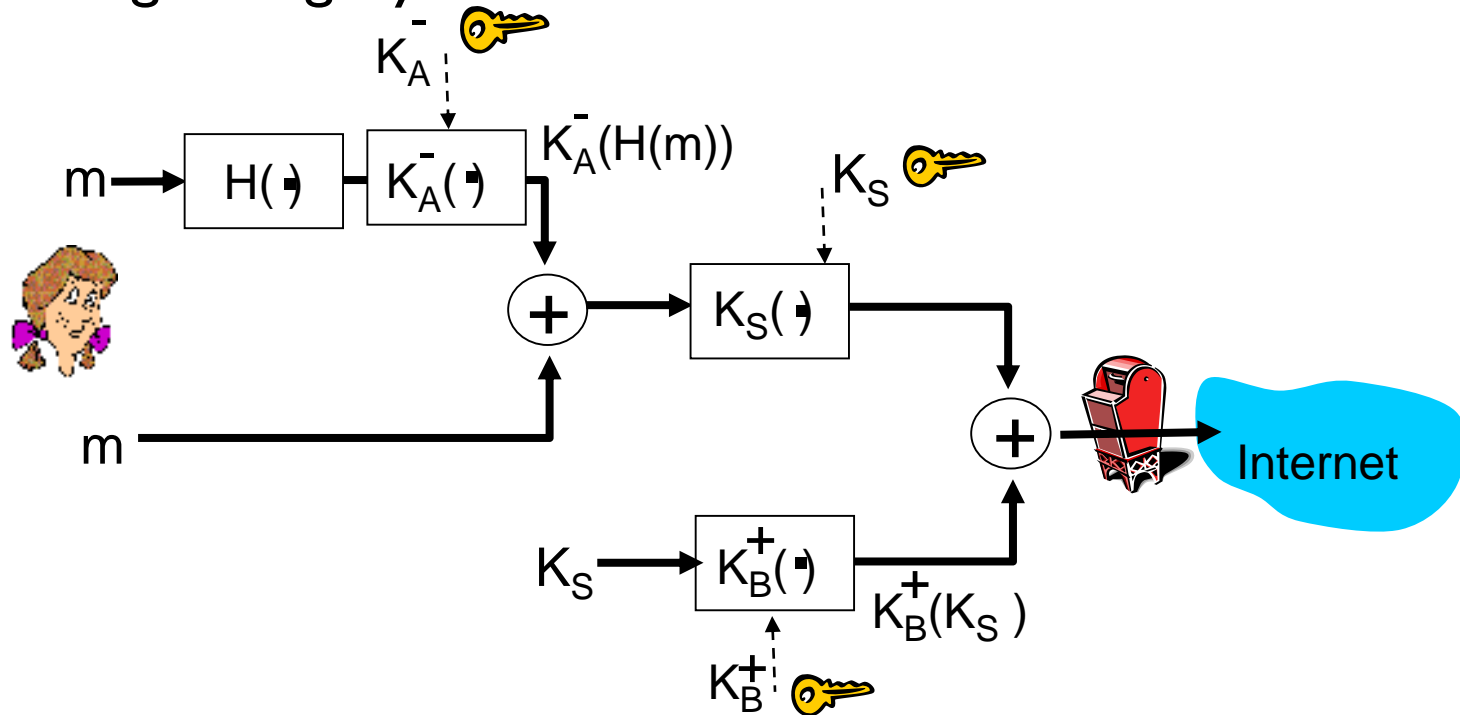

- ❖ Alice digitally signs message
- ❖ sends both message (in the clear) and digital signature

# Secure e-mail (continued)

- ❖ Alice wants to provide secrecy, sender authentication, message integrity.

*Alice uses three keys:* her private key, Bob's public key, newly created symmetric key
